

## 2009 ITS Project of the Year Award

### Finalist Project

#### INDOT Traffic Management Strategic Deployment Plan

This “project” outlines the deployment plan for the INDOT Traffic Management system in a statewide manner through FY 2020. This plan provides the necessary focus on the priorities of expanding the existing traffic management system in Indiana. It also gives the overall vision for the entire system and logically categorizes the build out process to meet the vision for the system.

This document gives the Who, What, Where, When and Why of the proposed traffic management system. It is comprehensive enough that the target audience ranges from as high as the governor to the plan designer and to the general public. If you are unfamiliar with the structure of the traffic management business unit this document provides that

overview and details the expected budgets and funding for each division. The plan summarizes the existing system, provides context with major interstate and freeway projects, overviews committed deployments and further defines the deployments by type of deployment and by chronological deployment.

The graphics in the document are used to develop the need for each of the proposed deployments and are further used to indicate the proposed locations for these devices. Overall this document encompasses a very large planning effort and results in a user friendly roadmap on accomplishing the goals of the traffic management system.

**Project Lead:** Indiana Department of Transportation – Traffic Management Business Unit
